Web Real-Time Communications (WebRTC) is the most disruptive communications technology to become available in 135 years.   It will change the face of the Two Trillion Dollar global telecommunications industry by making royalty-free, communications interfaces available in internet browsers and applications. WebRTC for Enterprises is the story of where the technology came from, how it is being used now and the future of the technology. It also includes a series of enterprise, industry-specific use-cases for the technology. Some use-cases are in production and some are under development.   WebRTC represents the convergence of unified communications with the World Wide Web. Its a big step away from the traditional public switched telephone network (PSTN), and a big step towards any-to-any rich communications. Enterprises that harness this technology will reap similar benefits to those that adopted the web in the early 90s. The technology renders communications tools in web pages. In other words, every web site can now be a telecommunications switch. Text, audio, video, screen sharing, co-browsing and document sharing are now available in a low cost interface that can be accessed from Billions of devices.
